

Nyalic® once again, gets into high places

Lofty heights are not unknown to Nyalic. its been fired into space, shot to the moon and is used in many places where we don't know its there. On the London skyline (and many other major cities) Nyalic is in extensive use on industrial cranes.

A New Zealand company, Farra Engineering who are 'world renowned' for constructing unusual equipment for unusual projects have established yet another technological marvel on the London skyline.

Window cleaning platforms might seem a strange place for Nyalic but due to the corrosive chemistry used by maintenance crews, protection of their equipment is paramount.

The equipment, a Sydney example shown below is recognized as world class in its market. The business cluster of Engineering excellence in Dunedin must be commended.

A photograph of a large, silver, rectangular industrial machine on wheels. The machine has a perforated metal front panel and a cylindrical tank on the left side. It is situated in a workshop or factory setting.
