

Nyalic corrosion protection now available for agricultural equipment

With highly corrosive environments and chemicals causing agricultural equipment breakdown, farmers are vulnerable to high costs from maintenance, malfunction, lost productivity and revenue. It is critical farmers keep machines running by controlling, preventing and mitigating common corrosive agents from disabling and destroying equipment.

Nyalic is a clear, ultra-thin polymeric resin coating that significantly reduces corrosion risk by providing a protective seal, and unlike a wax or polish, Nyalic is designed to cover every part of a machine - internal and external.

A properly prepared and applied coating to a new machine will provide three years of protection, generating significant cost savings in equipment maintenance and down time.

The cost to coat a machine is typically less than 1% of the machine cost, and when a new machine is coated, the cost can be capitalised. Machine operators also have a DIY patch and fix option using Nyalic aerosol cans that come with complete instructions to achieve professional results.

NYALIC[®]
Clear Surface Protectant

Chalky chemistry affected paint will restore using Nyalic... and if its coated early in equipment life, the chalkiness can be prevented... a small investment in your business that delivers long term results
